INDIAN POPULATION - AN OVERVIEW

In 1960 the Bureau of the Census reported that approximately $\frac{1}{552,000}$ Indians¹ were living in the United States². As of 1970, it reported that 827,982 Indians were living in the United States, constituting less than one percent of the total U. S. population. Approximately, $355,738^{-3}$ or 45 percent of the Indian population in the continental United States lived in urban areas in 1970, while 436,992 or 55 percent resided in rural arcas. (Table 1)

As reported by the Census Bureau, the majority of Indians were located in 10 States: Alaska (51,528), Arizona (95,812), California (91,018), Montana (27,130), New Mexico (72,788), New York (28,355), North Carolina (44,406), Oklahoma (98,468), South Dakota (32,365), and Washington (33,386). About 20 percent of the total Indian population in the United States is concentrated in New Mexico and Arizona. (Table 2) The approximate location and distribution of the Indian population in the United States are shown in Figure 1.

As of 1970, approximately 342,300 or 38 percent of all Indians in the United States lived on or adjacent to Federal reservations in 24 States. (Table 3) About 11,000 Indians lived on State reservations in Connecticut, Maine, New York, South Carolina, Texas, and Virginia.

According to the 1970 Census, 390,755 Indians lived in the western $\frac{6}{100}$ of the United States; 152,291 (38 percent) resided in urban areas $\frac{7}{100}$ while 238,464 (62 percent) lived in rural areas. In 1960, the Census Bureau estimated that out of the total Indian population of 271, 036 living in the western region 60,151 (22 percent) lived in urban areas, and 210,885 (78 percent) lived in rural areas.

There was an absolute increase in Indian population between 1960 and 1970 of about 44.2 percent for the western region. During these same ten years, the number of Indians residing in urban areas in this region increased by 153.2 percent, while the number living in rural areas increased by only 13.1 percent. As with other groups, the Indian $\frac{9}{7}$ population is apparently shifting from rural to urban areas. (Table 3A)

THE INDIAN POPULATION IN NEW MEXICO AND ARIZONA

In 1970, the Census Bureau reported that 95,812 Indians were living in Arizona, and 72,788 Indians were living in New Mexico. The Bureau of Indian Affairs, on the other hand, estimated that in 1970 there were 114,400 Indians residing in Arizona and 77,400 Indians living in New $\frac{10}{10}$ Mexico. (Tables 4 and 5)

Almost 50,000 (50 percent) Indians in Arizona were concentrated in two counties: Apache County (23,994) and Navajo County (23,023). Other counties in Arizona having a significant Indian population included Coconino (11,996), Gila (4,591), Pima (8,837), and Pinal (6,405). Maricopa County which includes the State's largest metropolitan area, Phoenix, had about 11,159 Indians in 1970.

In New Mexico 40,000 (over 55 percent) were located in two counties--San Juan County (18,439) and McKinley County (26,507). There were also significant numbers of Indians living in Otero (1,620), Rio Arriba (2,755), Sandoval (6,796), and Valencia (6,080) counties. Bernalillo County which includes the Albuquerque, the State's largest metropolitan area, had about 5,839 Indians in 1970.

Urban Population

Despite an apparent national trend of Indians shifting from rural to urban areas, in actual numbers, few Indians live in urban areas in either Arizona or New Mexico. In Arizona the Census Bureau recorded 18,174 Indians (19 percent) of the State's Indian population, 1.3 percent of the total population, living in urban areas. Most of the Indians living in urban areas are concentrated in two metropolitan areas -- Phoenix and Tucson. (Table 6)

The Phoenix metropolitan area includes four major cities--Mesa, Phoenix, Scottsdale, and Tempe. The city of Phoenix had a population of 581,562 in 1970. Of this total, 5,893 were identified as Indian. The 1970 Census also recorded 348 Indians living in Mesa, 248 in Scottsdale, and 304 in Tempe. The remainder of the Indian population (1,480) living in the Phoenix metropolitan area was in other incorporated areas of Maricopa County.

Tucson is the second largest city in Arizona with a total population of 262,933 in 1970. Of this total, 1,926 were identified as Indians. Other cities having a significant Indian population in Arizona are Flagstaff (1,324) and Yuma (202).

According to the 1970 Census, about 13,331 (18.3 percent) of the Indian population; less than 2 percent of the total population in New Mexico, resided in urban areas. (Table 7) The majority of those Indians we: concentrated in four cities: Albuquerque (5,839), Farmington (1,450), Gallup (2,141) and Hobbs (1,202).

Rural Population

11/

In contrast with the small numbers of Indians in urban areas, 21.4 percent of the rural population in Arizona consisted of Indians and 19.4 percent of the total rural population in New Mexico was Indian.

Besides the Bureau of the Census and State population data an important source of information on Indians comes from the area offices.

The Bureau of Indian Affairs has divided the U.S. into 12 administrative areas. Each administrative area is further divided into area agencies. In the region encompassing New Mexico and Arizona there are three BIA administrative areas--the Albuquerque Area, the Navajo Area, and the Phoenix Area. The Albuquerque Area includes the States of New Mexico and Colorado; the Phoenix Area encompasses Arizona, Utah, Nevada, and parts of Idaho and Oregon, as well as the Hopi Reservation. The Navajo Area is a separate administrative area encompassing only the Navajo Reservation. (Figure 2)

According to BIA population estimates, 191,775 Indians were living on or adjacent to Federal reservations in New Mexico and Arizona in <u>12/</u> 1971. Arizona had approximately 114,400 and New Mexico had about 77,400 Indians living on or near reservations. (Tables 8 and 9)

By far the largest reservation in the nation--is the Navajo Reservation. This reservation encompasses almost 14,000,000 acres spread over a three State area--New Mexico, Arizona, and Utah. The total estimated population in 1971 of the Navajo Reservation was about 128,123. Approximately 73,657 Navajos (57.5 percent) lived in Arizona; about 50,069 (39 percent) of the Navajo population lived in New Mexico, and only 4,398 (3.4 percent) of the Navajo population lived in Utah. (Figure 3)

Birthrates and Family Size

The Indian population Nationwide is very young. According to the 1960 Census, the median age for rural Indians was 17.7 years compared with 27.3 for the total rural population. More than 60 percent of the rural Indian population in 1960 was under 25 years of age, (Table 10), as compared with only 48 percent of the total rural population. According to 1972 BIA estimates, the median age for rural Indians in 1970 was approximately 18 years. About 63 percent of the rural Indian population was under 25 years of age and over 40 percent of the rural Indian population was under 16. (Table 11) Figures 4 and 5 show graphically the distribution of Indian and total population by age in 1960.

Indians have one of the highest birth rates of any ethnic group the United States. In 1968 the Public Health Service reported that the birth rate among Indians was 38.5 live births for each 1000 Indians. This rate was 2.2 times as high as the total population rate of 13/ 17.5. Birth rates for the combined Indian and Alaska Native group have increased almost every year from 1955 to 1968. In contrast, rates for the country as a whole declined in each of the years from 1958 14/ through 1968.

Although American Indians have one of the highest birth rates of any minority group, the life expectancy at birth for Indians was below that of the United States as a whole. In 1970 the life expectancy for Indians and Alaska Natives was 64 years as compared to 70 for the $\frac{15}{}$ general population.

The average size of Indian families is large. Two out of three rural Indian families have four persons or more, compared with one out of two families in the total rural population. More than one-fourth of the rural Indian families have seven members or more.^{17/} The large size of Indian families reflects, in part, the age structure of the Indian population and its high birth rate, but it also reflects the socio-cultural orientation of the Indian family structure.

In a 1969 manpower survey of five reservations in New Mexico and Arizona, conducted jointly by the Arizona State Employment Service and Arizona State University in Tempe, Arizona, it was reported that the median family size is six on the Papago, Acoma and Laguna reservations and seven on the Fort Apache and San Carlos reservations.^{20/} The survey also reported that almost 9 percent of the families on the Fort Apache Reservation have eight or more children, and approximately five percent have seven children. On the San Carlos Reservation nearly 14 percent of the families have eight or more children. On the Acoma Reservation in New Mexico, the survey reported that approximately 16 percent of the families living on the reservation have eight or more children.

EDUCATION OF AMERICAN INDIANS

Enrollment

More than 44,500 American Indians attend public schools in New Mexico and Arizona. In New Mexico, Indians constitute about 7.5 percent of the public school enrollment, and approximately 4.9 percent of the public school population in Arizona (Tables 12 and 13).

The concentration of the Indian school population in New Mexico is in three counties (Table 14) About 60 percent of the public school enrollment in McKinley, 51 percent of Sandoval, and 31 percent of San Juan County, is American Indian.

In Arizona, most Indian children attending public schools are concentrated in Apache, Conconino, and Navajo counties. (Table 15) In Apache County they are almost 68 percent of the total school enrollment, in Conconino they are 26 percent, and $\frac{23}{}$ in Navajo they are 36 percent.

About 8,100 Indian children were attending public schools in the Albuquerque Area. In the Navajo Area, approximately 26,000 Navajos were enrolled in public schools. In the Phoenix Area, about 9,200 Indian children were attending public schools.

In addition to those Indian students attending public schools in the region, approximately 27,000 Indian children attended BIA operated boarding and day schools in Arizona $\frac{24}{}$ and New Mexico in 1971. (Table 16)

Number of School Years Completed

A comparison of the median number of years of school completed by various population groups, 25 years and older in those two States, shows a lower level of completion for American Indians than for Anglos, Mexican Americans, or blacks; one exception to the lower level attained by Indians is Indians residing in urban areas of Arizona. According to the U.S. Bureau of the Census, in 1970 the median number of years of school completed by the white population 25 years and over, was 12.3 years. For the black population it was 9.7 years, and for Mexican Americans the median number of years completed was 9.0 in $\frac{25}{}$ For Indians in Arizona the median was 7.8 and in New Mexico it was 8.0.

Median Years of School Completed by Persons Aged 25 Years and Over In New Mexico and Arizona, 1970

SOURCES:

<u>Census of Population: 1970.</u> <u>General Social and Economic</u> <u>Characteristics</u>. Final Report PC(1)-C4, <u>Arizona</u>. Tables 51 and 57. (Medians given for all ethnic groups except American Indians were either taken directly from Tables 51 or 57 or computed from figures given in either of these two tables.)

<u>Census of Population: 1970.</u> <u>General Social and Economic</u> <u>Characteristics</u>. Final Report PC(1)-C33, <u>New Mexico</u>. Tables 51 and 57. (Medians given for all ethnic groups except American Indians were either taken directly from Tables 51 or 57 or computed from figures given in either of these two tables.)

a/ Those figures given in this table for median years of school completed for the American Indian ethnic group were obtained from a tabulation entitled "Estimated Medians Based on Special Tabulations of American Indians in the 1970 Census One-Percent Public Use Samples" prepared by the U.S. Bureau of the Census at the request of the U.S. Commission on Civil Rights. Since these figures were derived from a one-percent sample, it should be understood that they are subject to sampling variability. (This tabulation was necessarily prepared in advance of publication in final report form of Volume II Subject Report 1F, American Indians.)

b/ As used in this table, the term "Spanish Heritage" is defined so as to include persons of Spanish language (comprised of persons of Spanish mother tongue and all other persons in families in which the head or wife reported Spanish as his or her mother tongue) and all other persons of Spanish surname. When reviewing the median educational attainment levels for American Indians two things should be noted. First, the number of years of schooling completed by Indians varies with each tribe. For example, in New Mexico and Arizona, the number of years completed by Indians living on reservations ranges from a low of 3.0 years on the San Felipe and Santa Ana Reservations in New Mexico, to a high of 11.0 years on the Colorado River and Fort McDowell Reservations in Arizona. (Table 17)

Second, although low when compared with other population groups, the educational attainment level among some Indians living on reservations has been increasing in recent years. For example, on the Navajo Reservation in 1969 the median number of school years completed by Navajo men under 30 years and women under 25 years old was eight. While Navajo men over 30 years old and women over 25 years old had completed 5 years of school or less.

School Achievement

Not only does the American Indian tend to have a lower educational attainment level than other population groups, but the average performance levels of Indian children attending public schools are often 2 or 3 years below those of white children.

In a Nation-wide educational survey in $1966^{\frac{27}{}}$ (the Coleman Study) the academic achievement of various racial and ethnic groups in grades 3,6,9, and 12 were compared. According to this study, American Indians in all achievement measures ranked behind white and Asian American students but ahead of Mexican Americans, Puerto Rican, and black students in that order.

The Department of Health, Education, and Welfare re-analyzed the same data used in the Coleman study and estimated the grade equivalent scores for each population group in grades 6 through 12, finding that the difference between the performance of American Indians and the performance of white students widens with each succeeding year, especially between grades 10-12. This pattern was most pronounced in mathematics and least pronounced in reading. In mathematics, American Indians are 2.1 years behind white students in the 6th grade, and 1.4 years below the norm; but at grade 12 American Indians are 2.7 years behind, and 2.1 years below the national norm. (Table 18)

One crucial point in achievement seems to occur between the 9th and 10th grades. Between grades 6 and 9 Indian children are consistently 1½ years behind in both reading and mathematics. In grade 10 through 12 they fall further behind each year.

In 1969, the New Mexico State Department of Education evaluated the achievement of 4,500 students in grades 5,8, and 11, using the $\frac{28}{}$ California Test of Basic Skills. According to the survey, Indian students performed well below the national norm on all three measures of achievement, reading, language, and arithmetic. Indian students exhibited their lowest achievement levels in reading, and scored consistently below all other racial and ethnic groups in the other test components. (Table 19A)

During the last week of January 1972, some 36,388 third grade 29/ students in Arizona were given the Metropolitan Achievement Test. Approximately 51 percent of those tested.scored at or below the National Grade Equivalent (as identified by Harcourt Bruce Jovanovich, Inc.)

of 3.4. The mean grade equivalent for those tested was 3.1. The test results showed that only 20 percent of the Indian third grade students scored above 3.4, whereas 69 percent of the Asian American, 61 percent of the Anglo, 29 percent of the Spanish surnamed, and 26 percent of the black students scored above 3.4. (Table 19B)

A recent survey of five reservations in New Mexico and Arizona found that educational attainments ranged from a low of 7 years of school completed on the Papago reservation to 11 years on the Laguna reservation.

The Acoma, San Carlos, and Fort Apache populations over 15 years $\frac{30}{}$ old had a median of 9 years of school completed. (Table 20)

Only 5.8 percent of the Indian males, and 6.2 percent of the Indian females in the sample population of this survey completed 8 years of school. The rate for all U. S. population groups in 1970 was $\frac{31}{}$ 13.4 percent. The survey also suggested that large numbers of Indian children fail to finish high school. For example, while 17.3 percent of the Indian males in the sample completed at least 3 years of high school, only 7.8 percent completed 4 years. (Table 21)

Dropout Rates

The dropout rates for Indian students enrolled in public schools is high compared to other population groups. In a study conducted by the Southwestern Cooperative Educational Laboratory, it was reported that the dropout rate for American Indian students nationwide from grade nine through twelve was 30.6 percent. This rate is somewhat higher than for students in general. The study reported that the

dropout rate for students in the United States was 22.7 percent.

The dropout rate for American Indians attending public schools 34/ in the Southwest between grades 8 and 12 was 38.7 percent, which was 10.1 percent higher than the 28.6 percent rate for the entire Southwest.

On the basis of 1962 sample of 8th grade Indian students attending public schools, it was reported that the dropout rate for Indians was $\frac{35}{34.7}$ percent in Arizona, and 33.9 percent for New Mexico.

During the 1970-71 school year in New Mexico, a total of 911 Indian pupils enrolled in school districts funded by the Johnson O'Malley program dropped out of school. (Table 22) In Arizona, during the 1970-71 school year, some 841 Indian students dropped out of the State's public schools. (Table 23) Most of the dropouts in both States occurred between grades 9 and 12. For example, in Arizona 515, or 63.7 percent of all Indian dropouts occurred between the 9th and the 11th grades. Of this total, 60 or 12 percent were withdrawn from school by their parents, 8 (1.5 percent) got married, 10 (2 percent) dropped out due to illness, 20 (4 percent) were expelled from school, 6 died, and 409 (78 percent) dropped out of school because of over-<u>36</u>/ ageness, employment, drinking, low achievement and poor adjustment.

13

33/

Indian children in Arizona and New Mexico, like other minority groups, face special problems that complicate their educational experiences. In many instances, they encounter new concepts, values and attitudes when they enter school. In addition, many Indian children must learn English as a second language. A large proportion of the Indian children living in the Southwest have also grown up in isolation both geographically and socially, and have had little or no experience with the larger society. These factors may $\frac{37}{2}$

Special Senate Subcommittee Report on Indian Education

A recent report of the Special Senate Subcommittee on Indian 38/ Education cites additional problems in the education of Indian children. Some of the Subcommittee's findings in 1969 illustrate the low quality of Indian education. For example:

> Forty thousand Navajo Indians, nearly a third of the entire tribe, are functional illiterates in English.

The average educational level of all Indians under Federal supervision is 5 school years.

More than one out of every five Indian men have less _= than 5 years of schooling.

Dropout rates for Indians are twice the national average.

The average age of top level BIA education administrators is 58 years.

In 1953, the BIA began a crash program to improve education for Navajo children. Between then and 1967, supervisory positions in BIA headquarters increased 113 percent; supervisory positions in BIA schools increased 144 percent; administrative and clerical positions in the BIA schools increased 94 percent. Yet, teaching positions increased only 20 percent.

In one school in Oklahoma the student body is 100 percent Indian; yet it is controlled by a three-man, non-Indian school board.

Only 18 percent of the students in Federal Indian schools go on to college; the national average is 50 percent.

Only 3 percent of the Indian students who enroll in college graduate; the national average is 32 percent; and

The BIA spends only \$18 per year per child on textbooks and supplies, compared to a national average of \$40.

In addition the Subcommittee noted that Indian children more than any other minority group, were prone to see themselves as inferior and "below average" in intelligence. $\frac{40}{}$ Concerning the quality of education in BIA schools the Subcommittee

stated:

The primary in-school cause of the low adequacy achievement levels of Indian students is the inadequacy of the instruction offered them for overcoming their severe environmental handicaps. A great proportion of the teachers in the BIA system lack the training necessary to teach pupils with the Linguistic and economic disadvantages of the Indian child successfully. Only a handful of the Bureau's teachers are themselves Indians, although some bilingual Indian teaching aides are employed. Virtually no non-Indian teachers learn to speak an Indian language, nor are they given formal help to do so. Many tend to take little interest in intellectual and artistic achievement, and therefore fail to stimulate the development of intellectual curiosity and creativity in their pupils.41/

In relation to the curricula used in BIA schools, the Subcommittee

noted:

The curriculums used in Bureau schools are generally inappropriate to the experience and needs of the students. Those for teaching linguistic skills are particularly unsuitable, as they fail to respond to the Indian child's unique language problems. Vocational training courses bear little relation to existing job markets. The teaching techniques commonly employed force upon Indian students a competition alien to their upbringings. 42/

Adult education on Indian reservations was also found to be wanting. The subcommittee report noted that in addition to the 75,000 Indian adults who have not completed a fifth grade education, there are thousands more who have completed more than five grades, but who still cannot read or write English at a fifth grade level. Less than one-fifth of the adult Indian population has completed high school or its equivalent.

EMPLOYMENT STATUS OF AMERICAN INDIANS

In order to better understand the present employment status of American Indians, one should first review the cultural and philosophical differences existing between Indians and the larger 44/society. For example, anthropologists have noted that Indians are more likely to place a higher value on the present rather than plan for the future. Also, punctuality is not an important element in the Indian's culture. In highly industrialized societies punctuality is a very desirable, even essential, quality. This is not true in most Indian cultures. Part of the reason for this is that Indians usually perceive life as being one with nature. In this context, motivation relates primarily to immed wite goals and objectives.

Indians also place a great deal of emphasis on cooperation. Some Indian tribes are highly individualistic and competitive, but many Indian communities place sharing and cooperation above individual differences and competition. Thus from a cultural perspective, American Indians tend to perceive work and employment differently than other population groups in the United States.

In analyzing the employment status of Indians in Arizona and New Mexico, a distinction is usually made between those Indians who work on reservations and those Indians who work off

reservations. This distinction is important because even though both reservation and non-reservation Indians suffer from high unemployment the reason for this problem is somewhat different. The non-reservation Indian is frequently prevented from getting a job because of a lack of skills, while the reservation Indian simply has no jobs available. Reservation Indians live in areas remote from the growth and prosperity of the rest of the country. Often this social and economic isolation is compounded by geographical isolation. For example, most of the Navajo Reservation, encompassing some 24,000 square miles, is remote from any major non-reservation population centers.

Reservation Employment

The majority of Indians residing on reservations in New Mexico and Arizona are either unemployed or underemployed. The unemployment rate for reservation Indians ranges from a 45/low of two percent of the Fort McDowell Reservation in Arizona to a high of 89 percent on the Puertocito Reservation 46/in New Mexico. The overall unemployment rate for Indians 47/living in the Albuquerque Area in 1972 was 28 percent. For the Navajo Area, it was 44 percent; and, for the Phoenix Area it was 36 percent. In contrast, the unemployment rate for New Mexico as a whole averaged 6.7 percent (seasonablly adjusted) 48/and 4.5 percent for Arizona in 1972. (Tables 24 and 25)

Unemployment rates for some reservations may vary as much as tend to fifteen percentage points over a single year. This fluctuation is probably due to at least two factors. First, the labor force in these reservations is relatively small and very transient. Second, the capital investment on these reservations is so small and sporadic that even a small labor force cannot be sustained over time. Indians on these reservations either drop out of the labor force or leave the reservation to seek employment.

Many jobs on reservations are seasonal in nature. For example, in a recent manpower survey conducted for the Arizona State Employment <u>49</u>/ Service, about 29 percent of those employed on the Fort Apache Reservation were employed in seasonal jobs. On the San Carlos and Papago Reservations, 27.8 and 33.6 percent, respectively, were employed seasonally. Acoma and Laguna Reservations in New Mexico had seasonal employment rates of 25 and 11 percent, respectively. The following table summarizes the type of employment found on these reservations.

Type of Employment	FT. APACHE	PERCENT OF SAN CARLOS	ACCMA	LAGUNA	PAPAGO
inipato vincine			11007.01		
Year-Round	44.2%	52.1%	61.6%	71.5%	46.3%
Seasonal	28.9	27.8	25.0	11.0	33.6
Irregular	26.9	20.1	13.4	16.8	20.2
Total	100.0	100.0	100.0	93.3	100.0
Number	301	169	112	136	134

Usual type of Employment: By Reservation

Many Indians are employed to develop natural resources. For example, on the Fort Apache Reservation, Arizona, approximately 24 percent of the labor force works in the lumber industry. Lumbering and related work are also important to the San Carlos Apaches. The Acoma and Laguna Pueblos of New Mexico employ many Indians in mining, primarily at the Anaconda uranium mining operations located on the reservation.

Many Indians residing in New Mexico and Arizona are also engaged in government and service related employment. Government employment on reservations is provided mainly by the Federal government especially by the Bureau of Indian Affairs, and the Indian Health Service. Some States and local governmental units also maintain reservation operations and hire indigenous personnel. The numbers employed, however, are very small.

The largest employer in the services sector on reservations is usually the tribe. For example, in 1969 on the Fort Apache Reservation, 236 Indians were employed by the tribe out of a total non-farm employment of 858. The Navajo Tribe (including the Office of Navajo Economic Opportunity (ONEO) employed about 5,450 persons which is about 45 percent of all the employed persons on the reservation and more significantly 65.8 $\frac{50}{}$ percent of all the wage and salary workers.

More than 50 percent of those employed on the San Carlos Reservation were employed in the governmental sector. The corresponding figures for the Acoma, Laguna and Papago Reservations were $\frac{51}{2}$ 30,38, and 33 percent, respectively.

Many Indians are self-employed and engaged in traditional occupations such as silversmithing, sheepherding, rugueaving, and farming. Exact figures indicating the extent of self-employment among Indians are not available for most of the reservations. However, the <u>Navajo Manpower</u> <u>Survey</u> did indicate that approximately one-third (31.3 percent) of all employed Navajos consider themselves self-employed. The majority of these worked in traditional occupations; very few were working in small businesses $\frac{52}{}$ such as stores or service stations.

Employment data for the Navajo Reservation indicates that 15.7 percent of the employed labor force is in the professional and managerial

category; 5.4 percent is in the clerical category; 15.7 percent is in the service category, and 1.2 percent is in the sales job category. Manufacturing and trade each employed approximately 800 people or 9.7 percent of the wage and salary workers. All of the other industrial classifications employed less than 6.0 percent of the Navajo labor force.

For Navajo women, self-employment is a more common source of work than for men. According to the <u>Navajo Manpower Survey</u>, 43.7 percent of all employed women worked in this category. Three thousand-three hundred and fifty female wage and salary workers are concentrated in four industries: government, services, manufacturing, and trade. Nearly one-half (49.2 percent) are employed in the government sector; an additional 28.3 percent are engaged in services. Manufacturing and trade firms engage 10.4 percent each.

Employment of males on the Navajo Reservation is concentrated in blue-collar occupations. The <u>Navajo Manpower Survey</u> reported that approximately 3,150 Navajo males (of a total 4,950 in the labor force) are engaged in the skilled (27.3 percent) semiskilled (9.1 percent) $\frac{55}{}$ or unskilled (27.3 percent) job categories.

About 17 percent of the Navajo men reported that they were $\frac{56}{}$ men professional and managerial occupations. Most of these jobs are connected with government (including elected tribal officials). Service occupations were reported by 13.1 percent of the employed men. Very few Navajo men are employed in clerical (3.0 percent), sales (1.0 $\frac{58}{}$ percent) and farming occupations (2.0 percent).

Agricultural employment plays a larger role in the Navajo economy than the <u>Navajo Manpower Survey</u> results would indicate. Most of the farm labor performed by Navajos is usually accomplished on a migratory basis. As a result many Navajos live off the reservation while employed and were not necessarily included in the survey.

The reservation labor force in Arizona and New Mexico has an extremely high rate of unemployment caused in part by low levels of educational attainment lack of skills, and a scarcity of jobs on the reservations.

Off-reservation Employment

62/

In 1970, the Equal Employment Opportunity Commission surveyed 466 separate business units in New Mexico. These businesses employed 77,335 persons. Three point eight percent, or 2,968 employees in the surveyed labor force were Indian. (Table 26)

In Arizona, EEOC surveyed 982 business units which employed 196,899 61/ persons. Only 3,152 or 1.5 percent of this labor force was Indian. (Table 27)

Minority employment in New Mexico was 26,332 (34 percent) of all the employees surveyed. If we consider Indians only in relation to the minority labor force, their participation rate is low, 3.8 percent of the minority labor force. A higher percent of Indian females than males are employed (6.5 percent as compared to 2.8 percent). In Arizona, minorities were 19.2 percent of the surveyed labor force. Indians were only 1.6 percent of the minority group. EEOC found that many Indians were employed in low status jobs. For example, in New Mexico, 1,991 or 67 percent of the Indians employees were in blue-collar occupations. In Arizona, 2,262 or 72 percent of the Indians were employed in low status jobs.

In New Mexico a higher rate of Indian women than of men were in professional, office and clerical, operative and service occupations. (Table 28) In Arizona Indian women also had higher participation rates than Indian males in the professional, technical, operative, and service occupations. (Table 29)

Of the 37,218 employees surveyed in Albuquerque, New Mexico, 864 or 2.3 percent were Indian. Of these,475 or (55 percent) were males, and 389 were females. Indian males made up two percent of the total male labor force, and Indian females made up 3.0 percent of the female labor force in Albuquerque. (Table 30)

Eight hundred sixty-four Indians employed in the private sector (28 percent) were located in Albuquerque. About 49 percent of these were employed in operative, labor, and service occupations, and 5.1 percent were employed in white collar or skilled categories. Two hundred ninty-one or 61 percent of the Indian males, and 159 or 30 percent of the Indian females were employed in low-skill jobs.

In the Phoenix metropolitan area EEOC reported that 1,163 American Indians,out of a total of 132,072 employees,were employed in 659 industries and commerical establishments, less than 1 percent. (Table 31) Of the minority labor force, Indians were only 7 percent.

Fifty-six percent or 649 of these Indians were employed in low-skill occupations. Sixty-four percent of the total minority labor force were in low skill jobs. Of the 744 Indian males, 337 or 47 percent were employed in white-collar jobs. Forty-two percent of the employed Indian females worked in professional, technical, sales, office, clerical and craftsmen occupations.

The EEOC statistics indicate that a significant portion of the non-reservation Indian labor force is employed in blue-collar jobs. Of the 6120 Indians surveyed in both states, 4,253 or 69 percent were employed in the operative, unskilled and service occupations. In contrast only 17.6 percent of the rest of the work force were employed in these occupations.

When compared with other minority groups, Indians fared somewhat better. Of the 57,919 black, Spanish Surnamed, and Asian American employees in the survey, 61.2 percent worked in low skill occupations. Yet, in the survey only 19.6 percent of the white employees in New Mexico, and 28.9 percent of the white employees in Arizona worked in blue collar jobs.

On the national level, there are similarities between the occupational patterns of rural, nonreservation Indians and other rural people. Both populations are predominantly in nonfarm occupations. According to the 1960 Census, 53 percent of the employed rural Indians and 61 percent of the total employed rural population were in nonfarm, nonwhite collar occupations. (Table 32) About 38 percent of both

groups were in low skill jobs, and a slightly larger percentage of rural Indians than the total rural population were in service work (13 and 9 percent, respectively). In white collar and skilled occupations on the other hand, there were 28 percent of all rural people as compared to 12 percent for Indians. These census figures reflect the lack of nonfarm $\frac{63}{}$ job opportunities for and the educational attainment of rural Indians.

State Government Employment

New Mexico State agencies employed only 198 Indians out of a total of 10,557 State employees in 1972. While Indians made up 7.2 percent of the State's population, they occupied only 1.9 percent of the State jobs. (Table 33) All together, only 20 state agencies out of a total of 73 employed any Indians, and the majority of Indians were employed in three major state agencies -- the Employment Security Commission, the Department of Health and Social Services, and the Highway Department. Over 85 percent of all Indian state employees were located in four counties--Bernalillo (40), McKinley (55), San Juan (38) and Santa Fe (37). (Table 34) In Bernalillo County, American Indians occupied 40 positions out of a total of 1,666 State jobs. Although Indians made up 53.9 percent of the population in McKinley County, they held only 41 percent of the state jobs there.

According to the Arizona Civil Rights Commission, 3,435 or 12.8 percent of the State's 26,918 employees in 1971 were members of minority groups. Mexican Americans made up 7.2 percent of State employees. Blacks comprised 3.4 percent of the State employees and

Asian Americans constituted less than one percent of the state employees. American Indians, were only 1.6 percent of the State work force, although they represent 5.4 percent of the State's population. (Table 35)

With the exception of Asian Americans, minority groups members in various States agencies in Arizona were under-represented in white-collar and skilled craftsmen jobs; instead, they were concentrated in the blue-collar jobs. (Tables 36-38). Of the 418 Indians employed by Arizona State agencies in 1971, 264 or 63.1 percent were in white collar or skilled jobs, while 154 were employed in low skill occupations. However, Indians were only 1.2 percent of all the employees in the white-collar jobs. They were 2.8 percent of all the employees in blue- collar occupations.

Indians made up less than one percent of all the Executive and Manager positions in the State government. (Table 38)

About 22 percent of all Indians employed in the State government were in a professional category. However, Indians constituted only one percent of the professional employees, while white employees fill 93.6 percent of these jobs.

To summarize, both Arizona and New Mexico State agencies employ very few American Indians. For example, in New Mexico, while Indians make up 7.2 percent of the State's population, they comprise only 1.9 percent of all the State's government employment. In Arizona, although Indians constitute 5.4 percent of the State's population, they fill only 1.6 percent of the total State government's jobs. Those Indians

that are employed by these States are, for the most part, in low skill or low status positions.

Federal Employment

American Indians are well represented in jobs with the Federal <u>64</u>/ Government. However, a large percentage are concentrated in the lower grade and wage board levels. In 1967, 10.8 percent of all Federal employees in New Mexico were identified as American Indians, a slightly higher proportion than the State's total population. They held 26.6 percent of all classified jobs at grades GS-1 through 4 , but only 4.1 percent in grades GS-9 to 11, and 2.6 percent in grades GS-12 to 18. At the same time, they constituted 15.7 percent of all wage board members in the State, but were 29.5 percent of all blue-collar workers earning less than \$5,499 annually. Indians held less than one percent of all jobs in the Post Office in 1967; nearly all of these were concentrated in the low-paying PFS-1 through PFS-4 positions. (Table 39)

In 1970, the number of Indians employed by the Federal Government increased to 3,006, 13.1 percent of all Federal employees in New Mexico. The number of Indians employed at grades 1 through 4 increased to 35 percent. However, the number of Indians employed in grades GS-9 through 11 increased to only 5.4 percent. In the GS-12 to 18 grades the increase was only one percent. Indians employed in the wage board category decreased only slightly from 1967 to 17.8 percent. Indians earning less than \$5,499 annually decreased in 1970 to 16.4 percent. At the same time the number of Indians earning more than \$5,500 annually

increased to 33.9 percent, and those earning more than \$7,000 a year increased by almost eighteen percent over 1967. In general, there has been a definite improvement in the blue collar status of Indian workers when compared with 1967 figures.

Similiarly, some improvement in the employment conditions of Indians in Arizona is evident when figures for 1970 are compared with those for 1967. In Arizona, 17.6 percent of all Federal employees were classified as Indians in 1970. (Table 40) This represented more than three times the percentage of Indians living in the State. Indians held 43.6 percent of all classified jobs at grades GS-1 through 4, but only 5.1 percent in grades GS-9 through 11. In the GS-12 to 18 category Indians held only 1.8 percent of all the positions, a decrease of almost 4 percent since 1967. In the wage board system Indians constituted about 20 percent of the total employees, but they were 61.3 percent of all those earning under \$5,499 annually. This represented an increase of fifteen percent over 1967. However, the Indian workers increased significantly in all other wage categories. For example, there was an increase of 18 percent over 1967 in the \$5,500 through \$6,999 wage category, and a 14.7 percent increase in the \$7,000 through \$7,999 category. In addition there was a 4.1 percent increase in the number of Indians earning more than \$10,000 annually.

The largest Federal employer of Indians in the region is the Bureau of Indian Affairs. In 1971, 1,717 Indians in Arizona, and 1,633 in New Mexico were employed by the BIA in the General Schedule (GS)

pay system. In addition, 952 Indians in Arizona, and 608 in New Mexico were employed by the BIA as blue collar workers. Indians constituted about 61 percent of all the GS personnel employed by the BIA in Arizona (Table 41) and 57 percent of the GS employees in New Mexico (Table 42). However, about 67 percent of the Indian GS employees in Arizona, and approximately 60 percent of the Indian GS employees in New Mexico were employed in the GS-1 through 4 grade level. These statistics indicate a concentration of Indians at the lower grade levels.

INCOME

Low educational and occupational levels are usually accompanied with low incomes. According to the 1960 Census, more than three out of five rural Indian families receive less than \$3,000 in yearly income, nearly twice as many as the total rural population. Family income below the \$1,000 level was three times as prevalent among the rural Indian population as among the total rural population. At the other end of the scale, less than three percent of the rural Indian families had incomes of \$10,000 or more, whereas nearly 12 percent of the families in the total rural population reported income of \$10,000 or more. (Table 43)

The Indian Manpower Resource Survey indicated that Southwestern Indians have substantially lower incomes than other groups in that region, although the proportion of below poverty level incomes varies considerably from reservation to reservation. The yearly median family income of Indians residing on reservations ranges from \$1,200 on the

Havasupai Reservation, Arizona, to \$4,500 on the Colorado River, Arizona, and Jicarilla Reservation, New Mexico. In contrast, the median family income for white families in Arizona and New Mexico in 1970 was \$9,484 and \$8,117, respectively. The median family income for white families living in Arizona and New Mexico was two to four times greater than the median income for Indians living on the reservation. (Table 45)

For many Indians, income is derived from several sources. Many Indian families in New Mexico and Arizona receive public assistance from the Federal or State governments. Many reservation Indians also receive some income from land leases. Because of poor employment opportunities, minimal income is received from jobs. Therefore, despite several income sources, most reservation families have yearly incomes $\frac{65}{}$ below poverty levels.

The most important source of unearned income is gifts from relatives or private agencies. On the Laguna Reservation, for example, thirteen percent of the population is dependent upon such sources. On the San Carlos Reservation, 20 percent of the population identified gifts from churches, relatives, or other members of the family as $\frac{67}{}$ sources of income.

The most frequently mentioned sources of income, other than wages and salaries, were assistance payments from the Bureau of Indian Affairs, assistance payments from other public or private sources, pensions, including social security, veterans payments, and unemployment

compensation. It is evident that income other than wages and salaries is an important economic consideration for reservation Indians.

The Indian Manpower Resource Survey also reported that the median family income on a reservation is usually higher than median individual income

But even with income sharing, only one percent of the families on the San Carlos Reservation, Arizona, received \$10,000 or more in 1967. Approximately 10 percent received between \$5,000 and \$9,999, and another 16 to 17 percent received \$3,000 to \$4,999. Almost 72 percent of all families on this reservation received incomes of less than \$3,000 in 1967.

HOUSING

Indians living in Arizona and New Mexico live in worse housing than other racial and ethnic groups. Low income levels as well as families of large size accentuate the problem. Housing data compiled by the Bureau of Indian Affairs in 1972 for the Albuquerque, Navajo, and Phoenix Administrative Areas indicate the poor and often deplorable housing conditions in which Indians live. In the Albuquerque Area there were approximately 6,019 housing units on reservations. Of these units 3,017 or 50.1 percent were reported to be in substandard condition. One thousand seventeen or 17 percent of these substandard homes needed to be replaced, and the other 1,989 needed extensive renovation. The BIA estimated that 2,337 Indian families living on reservations in the Albuquerque Area needed new housing.

Housing conditions in the Navajo Area were reported to be just as poor. Of 22,143 units, only 2,828 were reported to be in standard condition, and 19,315 were reported to be in substandard condition. Approximately 5,987 units or 27 percent of these substandard houses needed to be replaced, and 13,328 needed extensive renovation.

In the Phoenix Area, of 8,183 units, 5,575 or 68.1 percent were classified as substandard. Ninety-two percent of these substandard units needed to be replaced and the remainder required renovation. The Bureau of Indian Affairs estimated that 1,036 Indian families living in the region needed new housing.

In summary, very few Indians residing on reservations in New Mexico and Arizona Îive in housing that could be characterized as adequate or standard. Of a total of 36,345 units in these three administrative regions, 27,907 or approximately 77 percent were in substandard condition. Most of the current housing on reservations is deteriorating. The BIA estimated that some 4,214 Indian families living on reservations in the Albuquerque, Navajo and Phoenix Administrative Areas needed adequate housing.

INDIAN HEALTH

The health status of American Indians is inferior to that of other ethnic groups. 'Inferior health is the result of Indian's impoverished socio-economic status, limited education, inadequate and over crowded housing, poor nutrition, poor sanitary facilities, unsafe water supplies on reservations, and inadequate health services.

33

As noted above birth rates for Indians are 2.2 times higher than for the general U. S. population. The percentage of Indian registered live births which occur in hospitals has increased substantially since 1953 in the Albuquerque, Navajo and Phoenix Administrative Areas. Hospital births include all births that take place in hospitals, institutions, or births attended by physicians in clinics. From 1955 to 1968, the percentage of hospital live births born in the Albuquerque Area rose from 73.6 percent to 95.9 percent. For the Navajo Area it increased from 88.5 percent in 1955 to 97.0 percent in 1968. In Phoenix Area it increased from 94.3 percent in 1955 to 98.4 percent in 1968. The comparable rate for the total population in the United States in 1968 $\frac{72}{}$ was 98.5 percent.

The infant death rate among American Indians has declined considerably between 1955 and 1967, from 62.5 to 32.2 infant deaths per 1000 live $\frac{73}{}$ births. In the Albuquerque Area, the death rate for infants among families in 1955 was 86.8 per 1000. For the Navajo Area it was 87.8 $\frac{74}{}$ per 1000, and for the Phoenix Area it was 48.0 per 1000. The comparable rate for all races in the United States was 26.4 in 1955. In 1967, the death rate among Indian infants in the Albuquerque Area declined to 37.1 per 1000. In the Navajo Area, the rate in 1967 was $\frac{75}{}$ 38.7 and for the Phoenix Area it was 17.9 per 1000. The rate for the United States was 22.4 per 1000 in 1967. These statistics indicate

34

that while Indian infant death rates have been declining, the rates were still above the U. S. norm. The one exception is in the Phoenix Area which recorded an infant death rate below the U. S. rate.

According to the Indian Health Service, Indian infant mortality "exceeds that for the general population as a result of high mortality in the days after the infant has left the hospital and returned home." The Indian Health Service also noted that whereas there is little difference between the two population groups under seven days of age, Indian and Alaska native rates have been 3, 4, and 5 times as large as the total $\frac{77}{7}$. U. S. Rates in the postnatal period."

Thirteen causes account for about 78 percent of all Indian deaths $\frac{78}{78}$ and 86 percent of all deaths in the Unites States. (Table 47) In recent years over half of all Indian deaths have been attributed to four causes; accidents, diseases of the heart, malignant neoplasma, and influenza and pneumonia. For Indians, deaths caused by accidents, influenza and pneumonia, certain diseases of early childhood, cirrhosis of the liver, gastritis, homocide tuberculosis, congenital malformations, suicide and all other causes, generally exceed the U. S. rate. Death of Indians due to diseases of the heart, malignant neoplasms, and vascular lesions affecting the Central Nervous System were significantly under the U. S. rate for all races.

The accident death rate among Indians is especially significant when compared to the rate of United States total population. For instance, the IHS reported that Indian rates for traffic accidents were

*An abnormal growth of tissue

over four times the total U. S. rates. $\frac{80}{}$

The death rate among Indians from gastritis was also very high relative to the total U. S. rates. This disease is classified under "diarrheal diseases", and it is usually related to impoverished conditions which exist in many Indian environments.

The combined tuberculosis incidence rate for both Indians and Alaska Natives is about 8 times that of the total U. S. rate. While it has declined over the years, tuberculosis rates among Indians living in the Albuquerque, Navajo and Phoenix areas was still above total U. S. rates.

Another serious health problem among Indians in Arizona and New Mexico is trachoma.^{81/} It is all but extinct in the general population. The disease is highly communicable and flourishes in a hot, dry, windy climate. A number of special programs have been established since 1967 to control the disease, and since that year the nubmer of cases has declined. The IHS reported that there was a 47.9 percent decrease in reported cases from 1966 to 1967 and a drop of 7.0 percent from 1968 to 1969.

The age distribution of Indian deaths for all causes combined is much more weighted toward the young ages than the distribution of all deaths in the United States. For example, the IHS reported that 14 percent of all Indian and Alaska Native deaths occurring in 1967 were infant deaths. The median age was about 50 years, and only one-third occurred at age 65 or over. In contrast, of all deaths in the U. S.

36

in 1967, only 4.3 percent were under age 1 and the median was 70 years. (Table 50)

Life expectancy at birth is frequently cited as a basic measure of health status of a population group. The IHS noted that life expectance y rate tends to fluctuate more from year to year for Indians than for larger population groups, but in recent years life expectancy rates for all Indians has been about 64 years as compared to 71 years for whites, and 64 years for all nonwhites. $\frac{83}{}$

Mild and moderately severe nutrituional deficiencies are relatively common among Indians, especially in infants and preschool children. This problem is related to the low socio-economic status of reservation Indians and poor food habits.

As Indians have been caught more and more in the conflict between their traditional cultures and the demands of the larger society, mental health problems have increased. The seriousness of these problems among Indians is demonstrated by high suicide rates, the high rates of alcoholism and increasing emotional and behavioral disorders among Indian children.

The Indian Health Service has reported that suicide rates (age adjusted) among Indians are two times as high as the total U. S. rate. $\frac{84}{}$ The age adjusted homicide rate is 3.3 times as high as the total U. S. rate. Deaths from alcoholism are 6.5 times as high as in the general $\frac{86}{}$ population.

The conditions underlying the mental health problems of American Indians are related to the stresses brought about by their attempts to

37

adjust to the values of the larger society. The lack of opportunity, the unfulfilled expectations, the purposelessness of their existence, the ambivalence of their identities, and the over-dependency on the government all contribute to these problems.

¹Estimates of the Indian Population On or Adjacent to Federal Reservations, by Reservation: March 1971, BIA. The BIA has labeled its reservation statistics as "estimates" because they are not based to any major extent on actual population surveys as of a given date. The figures for each reservation are usually supplied by local BIA staff using the data sources available.

²Federal and State Indian Reservations, An EDA Handbook January 1971.

³ Mission and Other Church related or private schools.

⁴ Does not include the Southern Ute and Ute Mountain Reservations.

⁵ Northern Pueblos include the following reservations: Nambe, Picuris, Pojoaque San Ildefonso, San Juan, Santa Clara, Taos and Tesuque.

⁶ Southern Pueblos include the following reservations: Acoma, Cochiti, Isleta, Jemez, Laguna, Sandia, San Felipe, Santa Ana, Santo Domingo and Zia.

7 Does not include the Utah area (as of FY 71 1000 Navajos were attending Federal Schools, 1167 were attending Public schools and 170 were attending other schools).

8 Does not include the Nevada, Uintah and Ouray Agencies.

¹Source: <u>Bureau of the Census.</u> Current Population Reports, Series P-20 No. 207, (1970).

 2 The figures for the American Indian category were derived from the total population surveyed in the Indian Manpower Resources Survey. See footnote #20. The Percentage figures for each reservation by sex was added for each grade level to get an aggregated sum by sex. The average of this sum by grade completed is found in this table. The total population surveyed was 1783. Of this total, 924 were females and 859 were males.

Census of Population: 1970. General Social and Economic Characteristics. Final Report PC (1)-C33, New Mexico, Table 57.

1/ Median family income is defined as the amount which divides the distribution of all families of the particular ethnic group of the particular area into two equal subgroups, one subgroup having incomes above the median and the other having incomes below the median. (In computing those medians given in this table, the incomes of only those members of the family aged 14 years and over in each family were summed in order to derive total family income and then, in turn, the median family income of the particular universe was computed). The income figures are to be considered current as of April 1970; however, the incomes were actually received by family members during 1969.

2/ Estimated medians based on special tabulations of American Indians in the 1970 Census One-Percent Public Use Samples. U.S. Bureau of Census, Letter to USCCR, October, 1972.

Percent of Deaths for Leading Causes By Area - 1965-1967 (Thr	hree Year Total)

FOOTNOTES

FOOTNOTES

1/ Unless otherwise stated, the term Indian refers to all those so counted by the Bureau of the Census. Using a cultural definition, the Census Bureau counts all persons who report themselves as Indian or who are so regarded by the community regardless of tribe, place of residence or percent of Indian blood, including Alaskan natives. In contrast the BIA defines Indian as a member of a Federally recognized tribe, resident of a Federal reservation or having one-quarter or more Indian blood. Because of these different definitions, population figures for Indians will vary according to the source.

2/ The number of Indians living on reservations in 1960 is not precisely known. However, the BIA reported that about 360,000 Indians were living on reservations in 1960. Hearings on H.R. 10802 before the Senate Committee in Appropriations, 87th Congress, 2nd Session (1963).

6/ Federal And State Indian Reservations: An EDA Handbook, U.S. Department of Commerce, Economic Development Administration, January 1971.

7/ The Census Bureau includes the following states in its western region: Alaska, Hawaii, Washington, Oregon, California, Montana, Idaho, Wyoming, Nevada, Utah, Colorado, Arizona and New Mexico.

 $\underline{8}$ / According to the Census Bureau, an urbanized area consists of a central city, or cities, and surrounding closely settled territory. The definition also includes incorporated places of 2500 inhabitants, provided that each has a closely settled area of 100 housing units or more. All persons residing in an urbanized area are classified as urban.

9/ This rural to urban shift was also apparent for Indians living in other parts of the country. For example, in the northeastern part of the Nation the Census Bureau reported an increase of 135.3 percent in the number of Indians living in urban areas since 1960. In the north central part of the country the Census Bureau indicates that there was an increase of 119.1 percent in the number of Indians living in cities.

<u>10</u>/ The discrepancy in these population figures is due, in part, because of the different definitions used by the BIA and the Census Bureau to define Indiana. See footnote $\underline{1}/.$

 $\underline{11}/$ "Rural and "Reservation" are used interchangeably in this paper unless stated otherwise.

23/ The Navajo Reservation encompasses most of McKinley, San Juan (New Mexico) Apache and Navajo counties (Arizona), thus the extremely high Indian student population in this area.

24/ In fiscal year 1971 there were a total of 190,174 Indian children, age 5 to 18 attending public, Federal, private and mission schools in the United States. According to BIA statistics more than half (63.3 percent) of all Indian children of school age (5-18) attended public schools. Of those enrolled in school (including those over 18), 68.8 percent attended public schools, 35.7 percent attended Federal schools and 5.5 percent attended mission and other schools. 50/ Benjamin J. Taylor, Dennis J. O'Connor, et al. <u>Indian Manpower</u> <u>Resources in the Southwest: A Pilot Study</u>, Bureau of Business and Economic Research, Arizona State University (1969). The term white collar id defined by the Census Bureau to include the following major occupational groups: professional, technical, and kindred workers; managers and administrators, except those on farms; sales workers; and clerical and kindred workers.

The term blue collar is defined by the Census Bureau to include the following major occupational groups: craftsmen and kindred workers; operatives, except transport operatives; transport equipment operatives; and laborers except those on farms.

The term service worker is defined by the Census Bureau to include all those working in private households and non-private households.
